# 1 Introdeuction

This project aims to implement a peer to peer network. In the first step we design UML model and then we are going to explain each objects' attributes and methods.

## 2 UML model

We design the UML model in order to make the project more understandable, clearer and professional.

# 3 Objects

Now it's time to explain every obejct's duty.

#### 3.1 Streem

```
#stream()
addClient(ip,port)
removeClient(ip,port)
randInBuff()
sendMessage()
randInBuff()
```

We also need to add a dictionary to specify every client's message(s)

#### 3.2 Peer

#### 3.3 Packet Factory

packetFactory() would generate the packets every node needs to connect another with.

```
#packetFactory
parseBuf()
newReunion()
newAdv() #make a new advertise packet.
newReg() #make a new register packet.
```

#### 3.4 Packet

Every packet consists seven differntes parts: :PlainText which is the raw text message in the packet.

Node Sender Validator which make the packet valid.

**Header** where the information such as type of the packet and etc. are going to be there.

## **Body Action**

#### 3.5 Reunion

reunion(packet) checks the connection of the nodes to the root.

#reunion(packet)
getDest()

#### 3.6 Node

Every node has two parameters: **IP** and **Port**.

### 3.7 Resgister Request

regReq() sends IP/Port of a node to the root to ask if it can register it.

### 3.8 Register Response

regRes() should just send an from the root Ack to inform a node that it has been registerd in the root if the regReq() was successful.

#### 3.9 Advertise

adv(packet)

### 3.10 Mesasge

msg(packet)
